Scoring Parameters
Reference Guide

Tradgo.us - earnings direction models, part by part

---

1. Earnings Trade	**(profile: default)**
2. Claude +-	**(profile: plusminus)**
3. My Calls	**(profile: final)**
4. My Call +-	**(final + breakdown view)**
5. Claude New 13 Oct	**(Tab A - pre-earnings direction)**

All five are direction models. The first four share one scoring engine (earnings_engine.score) and differ only by which parameters are counted, their weights, the BUY/SELL cut-offs, and the exit rule. Claude New (Tab A) is a separate all-positive engine. The Option Scanner is a straddle/volatility scanner, not a direction model, so it is not included here.

Generated from the live backend code. Numbers reflect the code, not the stale docstrings.

The shared scoring engine (tabs 1-4)

Every parameter returns a bias between -1 (bearish) and +1 (bullish), or no value when the data provider has nothing. Each parameter's contribution is:

points = bias x weight (bias clamped to -1 .. +1)

The score is then centred on 50 (neutral):

score = 50 + (net / present) x 50 -> clamped to 0 .. 100

- net = sum of signed points across the parameters that had data.
- present = total weight of the parameters that had data (missing data is NOT counted as zero - it is simply left out, so a blank parameter never drags the score down).
- 50 = perfectly neutral / no data. Above 50 leans bullish, below 50 leans bearish.

Actionability gate

A BUY/SELL call is only emitted when coverage >= 40% of the total weight AND confidence >= 45. Otherwise the call is 'NO TRADE' regardless of score. (confidence = coverage x 0.5 + agreement x 0.5.)

The four profiles below all use this same formula. They differ only in the parameter list, the weights, the cut-offs, and the exit rule.

1. Earnings Trade

BUY >= 65 **STRONG BUY >= 80** **SELL <= 35** **STRONG SELL <= 20**

Profile: default. 12 parameters, weights sum to 100. This is the only profile with a STRONG tier. Exit rule: score-cross (exit when the score crosses back through 50).

#	Parameter	Wt	What it measures (data source)
1	EPS Estimates & Revisions	16	Direction/size of analyst EPS revisions, YoY + last-week revision counts (UnusualWhales); Finnhub surprise fallback
2	Revenue Estimates & Revisions	12	Revenue estimate revisions, YoY (UnusualWhales)
3	Forward Guidance / Outlook	8	Next fiscal-quarter EPS+revenue vs year ago (UnusualWhales)
4	Historical Earnings Reaction	6	Last 8 reports: beat-rate + average surprise (UnusualWhales)
5	Price Action + Relative Strength	14	Pre-earnings drift, EMA trend, RSI, key levels (daily bars + chain)
6	Sector & Market Regime	8	Market backdrop - SPY day change (live market)
7	Options Flow + OI Positioning	10	Net directional options flow + open-interest build + 13F institutional net (UnusualWhales + 13F)
8	Unusual Options Activity	5	Unusual-activity tape + calls-vs-puts flow by expiry (UnusualWhales)
9	Options Disparity / Put-Call Skew	4	Put/call skew + volume PCR before earnings (UnusualWhales)
10	Dark Pool / Off-Exchange	3	Off-exchange volume below vs above spot, capped +/-0.5 (UnusualWhales)
11	Peer Read-through	8	Peers' recent EPS surprises, else peer analyst consensus (Finnhub)
12	Short Interest + Insider	6	Short-squeeze tilt + insider open-market activity (UW + SEC filings)

2. Claude +-

BUY >= 58 **SELL <= 42** **no STRONG tier**

Profile: plusminus. This is the original plus/minus model kept alongside the current Earnings Trade tab.

Same 12 parameters and same weights as Earnings Trade (table in section 1).

What changes versus Earnings Trade:

- Cut-offs are tighter-to-neutral: BUY at 58 instead of 65, SELL at 42 instead of 35, and there is no STRONG tier.
- Exit rule is the implied-move hard stop/target instead of the score-cross exit:

Hard Stop = spot - side x 0.5 x implied move

Target = spot + side x 1.0 x implied move

plus a trail-to-entry once in profit and a 1-2 day time stop. (side = +1 for a BUY, -1 for a SELL.)

3. My Calls

BUY >= 58 **SELL <= 42** **no STRONG tier**

Profile: final. A re-weighted 10-parameter 'Final Earnings Structure'. It drops Peer Read-through and Short Interest + Insider, and rebalances the rest to a round 15/10/5 scheme. Data sources are unchanged from Earnings Trade. Exit rule: score-cross.

#	Parameter	Wt	Data source (same as Earnings Trade)
1	EPS Estimates & Revisions	15	Analyst EPS revisions (UnusualWhales + Finnhub fallback)
2	Revenue Estimates & Revisions	15	Revenue estimate revisions (UnusualWhales)
3	Forward Guidance & Outlook	15	Next-quarter guidance vs year ago (UnusualWhales)
4	Historical Earnings Reaction	15	Beat-rate + average surprise, last 8 reports (UnusualWhales)
5	Price Action & Technical Trend	10	Drift, EMA trend, RSI, key levels (daily bars + chain)
6	Options Flow + OI	10	Directional flow + OI build + institutional net (UW + 13F)
7	Dark Pool Activity	5	Off-exchange volume below vs above spot (UnusualWhales)
8	Unusual Options Activity	5	Unusual tape + flow by expiry (UnusualWhales)
9	Options Disparity + Put/Call Ratio	5	Skew + volume PCR (UnusualWhales)
10	Sector & Market Trend	5	Market backdrop - SPY day change (live market)

4. My Call +-

BUY >= 58 **SELL <= 42** **no STRONG tier**

Same scoring as My Calls: the identical 10-parameter 'final' structure, the same weights (table in section 3), and the same 58/42 cut-offs.

What 'My Call +-' adds

- A plus/minus Score Breakdown: the parameters are split into what is pushing the score UP (+) and what is pulling it DOWN (-), shown side by side, plus the dual stock / options view.
- This is a presentation layer over the My Calls score - the number and the call are the same.

Note on the exit rule

My Call +- currently runs on the 'final' profile, so it uses the score-cross exit (exit when the score crosses 50) - the same as My Calls. The implied-move hard stop/target (0.5x / 1.0x) is applied only to Claude +- (profile plusminus). If you want My Call +- to use the implied-move stop/target too, that is a small change we can make.

5. Claude New 13 Oct (Tab A)

BUY >= 65 **SELL <= 35** **NEUTRAL in between**

A separate pre-earnings DIRECTION engine (v2). It does not use the shared formula above - it uses an all-positive scale. 9 parameters; raw weights sum to 90 and are then normalised to 100. There is no STRONG tier and no coverage gate.

All-positive scoring

points = weight x (0.5 + 0.5 x bias) (bias present, clamped -1..+1)
points = weight x 0.5 (no data -> exactly half = neutral)

Half the weight is neutral; a bullish lean goes above half, a bearish lean below. A stock with no signal at all lands exactly at 50. Every row is then multiplied by 100/90 (~1.111) so the maximum is 100.

#	Parameter	Raw Wt	Norm.	Bias source (from the equity engine)
1	Options Positioning	16	17.8	composite - see split below
2	Price Action + Trend	14	15.6	price action / EMA / RSI / key levels
3	Insider Activity	12	13.3	short interest + insider filings
4	Peer Read-through	10	11.1	peers' EPS surprises / analyst consensus (Finnhub)
5	EPS Revisions	10	11.1	analyst EPS estimate revisions
6	Historical Reaction	10	11.1	beat-rate + surprise, last reports
7	Revenue Revisions	8	8.9	analyst revenue estimate revisions
8	Prior Guidance	6	6.7	next-quarter guidance vs year ago
9	Dark Pool	4	4.4	off-exchange volume (confirmation only)

Options sub-split (the 16-pt Options parameter)

Sub-parameter	Wt	Bias source
Disparity / skew	7	disparity + volume PCR
Flow + OI	6	options flow + OI positioning + institutional
Unusual activity	3	unusual options tape

Dark-pool special rule

Dark-pool trade side is unknown, so Dark Pool only moves off neutral when it AGREES with the options composite or with price action (same direction). If it disagrees, it is pinned to half weight. The row is flagged 'confirmed' when it counted.
